

WHALE-OS HUD LEGEND · 1/4

Top of the HUD. Shadow mode: every decision is hypothetical and scored against real settlements; no orders are placed.

- 1** Top bar – version, the series and market Jev is on, server load and API latency meters, UTC clock, days running.
- 2** SHADOW – the mode badge. Shadow = no orders, hypothetical P&L.
- 3** Agent tiles – one per agent (BOOK, WHALES, WEATHER, CRYPTO, HISTORY, XVENUE, RESEARCH). Line 1: sources · polling / idle / err % / offline (HISTORY: calibration table size and age). Line 2: signals in 24 h · latency · errors · w = trust weight. Dimmed = switched off in whale_os.yaml.
- 4** Sources – the public feeds the agents read; bars = recent latency, red bar = an error. A row lights up when it is used.
- 5** Inspector – the latest single vote: market, agent, p(yes), latency, payload, sources, hash, and the agent's reasoning. Votes · this market: each agent's probability against the market mid (the tick).
- 6** Reliability – per agent: trust weight, Brier score and skill vs the market on settled markets. Negative skill = worse than the price, so it is down-weighted automatically.
- 7** Decision field – the black hole: agents, data flow and Jev's live call. How to read it: last page.
- 8** Shadow P&L – total hypothetical P&L in cents per contract, after fees.
- 9** Rule strip – Jev fires only when 3 independent families agree, shadow mode, no orders.
- 10** JEV – the decider. Big number = probability for the side it likes. Badge: IDLE / HOLD / VETO / FIRE · BUY YES|NO. agree = families agreeing / quorum. Segments: one per agent (green = YES vs market, amber = NO, dim = flat, dark = abstain). Prior → posterior, entry price, net edge, and the gates (✓/X).
- 11** Book – live order-book ladder for the market Jev holds.
- 12** PNL – shadow P&L per contract with its running curve.

WHALE-OS HUD LEGEND · 2/4

Scroll down: the four live charts.

- 13 Candles** – hourly candles of the market Jev is looking at (last, mid, volume underneath).
- 14 Drift vs noise** – 120 resampled paths of the shadow P&L: is it real drift or luck? P(PROFIT), median and 5-95% range. Until enough fires settle it says how many are needed.

- 15 Bayes** – the market's price (prior) next to the pooled agents' probability (posterior). The gap is the edge; GATE says whether it clears fees.
- 16 Consensus matrix** – rows = agents, columns = recent evaluations: green YES, amber NO, dim flat, dark abstain. Bottom strip = Jev's action (green fire, red veto, dark hold).

WHALE-OS HUD LEGEND · 3/4

Bottom of the HUD: the shadow trade log, the agent log and the totals.

17 Trades_out.csv – every shadow fire, newest first: families agreeing, which agents, side and price, probability, P&L, open / settled / void.

18 Tail -f agents.log – the agent stream replayed: READ (data pulled), VOTE, FLAG (veto), FIRE.

19 Totals – signals read, fired, held, vetoes, shadow P&L, win rate, markets, cycle time; each with its trend line.

READING THE BLACK HOLE

Particles flowing in	an agent pulled data and voted: they travel source box → agent node → core. Colour = the agent's family.
Agent nodes	the glowing dots around the hole, one per enabled agent; they flare when they vote.
Consensus ring	the segmented ring hugging the horizon: one segment per agent (two-letter label). ■ green = leans YES vs the market · ■ amber = leans NO · ■ dim = flat (within 2c) · dark = abstained
Inside the horizon	Jev's live call: FIRE (green) / VETO (red) / HOLD / IDLE, with <i>agreeing/quorum · edge in cents</i> .
Jets from the poles	faint and breathing normally; they blaze when Jev fires.
Rings bursting from the core	a decision: green = fire, red = veto, grey-green = hold.
Disk, stars, lensing, photon ring	atmosphere only: they carry no data.

HOW JEV DECIDES

Families	agents reading the same data count once: BOOK + WHALES = one microstructure vote; WEATHER or CRYPTO = model; HISTORY = calibration.
Fire	3 families agree, at least 3 voters, and the edge is ≥ 3c per contract after Kalshi fees, priced as a taker.
Veto	a hard rule blocked it whatever the votes: spread too wide, one-sided book, price outside the band, too soon or too far from close, ambiguous rules text, or a blocked series.
Hold	not enough agreement or edge.

BEFORE ANY REAL MONEY

Go / no-go needs ≥ 400 settled fired markets over ≥ 100 independent events, and the lower end of the 95% range of P&L per contract above 0 after fees. Until then this is evidence-gathering. `./scripts/whale_os.sh report` prints where it stands.

OPEN IT

- 1 · On your PC, keep this window open (it opens GovAward too):
- `ssh -L 8890:127.0.0.1:8890 -L 8055:127.0.0.1:8055 root@vmi3134862.contaboserver.net`
- 2 · Browse to `http://localhost:8890`
If the page stops updating, the tunnel closed (PC slept, window closed): run step 1 again. WHALE-OS itself keeps running on the VPS.

ON THE VPS

`cd /root/whale-os/Swarm-Kalshi`
`./scripts/whale_os.sh status · report · logs`
Auto-restart check every 10 minutes; HISTORY table rebuilt every Sunday 04:17 server time.
